Executive Summary

On August 27, 2008, ASRT sent an invitation to participate in the ASRT Forensic Radiography Survey to all 720 National Association of Medical Examiners (NAME) members. As of September 25, 2008, a total of 77 responses had been received, yielding an 11% response rate. This rate resulted in an overall percentage confidence interval at the 95% level of about +10% for any response percentage to a question in the 40-60% range and +6% in the 70-90% range. With this response rate, one must take into consideration that there may be a response bias toward medical examiners that saw the survey invitation and responded because they were aware of the policies and equipment in their lab.

Detailed tables and charts of percentages and frequencies for each question, as well as cross-tabulations of various questions, are provided in the body of this report. The verbatim responses to questions appear in Appendix A.

Basic Frequencies and Descriptive Statistics

- Almost three-fourths (71.4%) of the respondents indicated their job title as medical examiner, with the remaining quarter selecting the “other” option. After further analysis 11.7% of these respondents were coded as pathologist and 7.8% as coroners, leaving the remaining 9.1% as “others.”

- The majority (68.9%) of respondents also indicated that their primary workplace is located at an office of medical examiners with approximately 10% working out of a coroner’s office and a combined 19.3% of respondents working at a private office, university or hospital.

- NAME members were asked if radiographic equipment is used at their facility. An overwhelming majority (88.3%) of respondents indicated that images were produced at their facility. Of those who responded “no” (11.7%), 100% specified upon further questioning that radiographic equipment is available at an off-site location.

- Respondents were asked to indicate the type of radiographic equipment that is available for their use either at their facility or at an off-site location. Of the equipment presented a fixed radiographic room with film and wet processor was the most accessible. Of those with this type of equipment, 70.5% of the respondents stated that they have access at their facility, 6.6% at an off-site location and less than a quarter (23.0%) have no access to fixed radiographic equipment. Ultrasound equipment was the least accessible to respondents; only a combined 25.4% have access to this equipment at their facility or at an off-site location. Almost three-fourths (74.5%) indicated they do not have any access to ultrasound equipment.

- More than one-half (64%) of respondents indicated that less than 25% of their cases require imaging, and only 5.3% of respondents indicated that more than 75% of the cases require imaging. Using a semi-quantitative variable resulted in a mean percentage of 24.69% cases requiring imaging, a median of 19.53%.
• Homicides, suicides, decomposed bodies, infant deaths, penetrating traumas, burn victims and unidentified bodies were listed as cases that required imaging. Homicides and infant deaths were indicated by almost all respondents, at 93% and 92% respectively.

• Respondents were asked to specify who was responsible for performing radiography at their facility and 44% indicated that a forensic assistant was responsible. About one-third (33.7%) said they are performed by a registered radiographer and 12.9% responded that the images are being produced by a forensic professional such as a medical examiner or coroner. As for training, the majority of respondents indicated performing radiography exams is done through on-the-job-training courses (50.7%), and only 5.6% indicated that no training is completed. When questioned further on who interprets these images 70.4% indicated that this was done by a forensic professional such as a medical examiner or coroner, with only one respondent relying solely on a radiologist.

• The hospital or university that houses the forensic department oversees regulation and inspection of radiographic equipment for 24.1% of respondents, a private organization performs these services for 22.2%. About 18% indicated that they were unsure or did not know how inspections of equipment were carried out.

• An overwhelming majority (88.8%) of respondents rated the images produced at their facility as good or excellent with only 2.8% stating that the quality of images produced at their facility were poor and required a comprehensive overhaul of their imaging program. When converted to a numeric scale of 0=poor to 3=excellent, the overall mean rating for quality was 2.16.

Cross-tabulations

• All (100%) of the 14 private, hospital, and university-based facilities employ registered radiographers (university- and hospital-based facilities, exclusively), while only one-third (18 of 54) of medical examiners’ offices (MEOs) and coroners’ offices do so.

• Similarly, only about one-fifth of the 57 MEOs and coroners’ offices require radiologic technologist certification, as compared to more than four-fifths of the 11 private, university-based, and hospital-based facilities. Further, all 4 of the facilities that have no training requirement were MEOs. This still represents only 8% of the 49 MEOs and the difference between MEOs and other facility types in this respect is not statistically significant.

• Private, hospital, and university-based facilities (PHUs) were significantly more likely (80%) to be required to be licensed than were MEOs and coroners’ offices (33%). In addition, though only significant at the .05 level, PHU facilities were less likely (4 of 10) to post technique charts than were MEOs and coroners’ offices (75%).

• Every respondent from a PHU facility who believed they knew who regulated and/or inspected the facility identified the hospital or university where the facility is housed. This was true of only 6 (16%) of the 37 similarly knowledgeable respondents from MEOs and coroners’ offices. Among MEOs and coroners’ offices, exactly one-third
(15 of 45) report being inspected/regulated by a governmental agency (significantly higher at the .05 level than the 0% of PHU facilities who so report) and another 26.7% say that a vendor or company inspects/regulated them. (This percentage is not statistically significantly higher than the PHU facilities’ 0%.)

- None of the differences with respect to perceived quality of the images produced among MEOs, coroners’ offices and PHU facilities was statistically significant.

- More than three-fourths (79%) of MEOs and coroners’ offices have their images interpreted by a forensic professional only, while this is true of only 38.5% of PHU facilities. Conversely, 17.5% of MEOs and coroners’ offices and 61.5% of PHU facilities have their images interpreted by both forensic professionals and radiologists.

*a Those who answered “Yes” were those respondents who matched the previous question and stated that radiographic equipment was not used in their facility.

*b Eight respondents answered “No” to this question; however, upon further analysis, all of them indicated in the previous question that radiographic equipment is used in their facility; therefore, 100% of those who responded use radiographic equipment either at their facility or at an off-site location.

| Total | | 47 | 3 | 7 | 2 | 4 | 5 | 68 |

Percentages and totals are based on respondents.

All (100%) of the 14 private, hospital and university-based facilities employ registered radiographers (university- and hospital-based facilities, exclusively), while only one-third (18 of 54) MEOs and coroners' offices do so; chi-square for this difference = 16.437 with
1 df, \( P < .001 \). However, all three of the “other” facility types (a regional and a county medical examiner and a military facility) employ registered radiographers to perform imaging exams. When the two CMEs are added to the office of medical examiners category, the percent of MEOs employing registered radiographers rises to 35.7%, which still is significantly lower than in private, university- and hospital-based facilities (chi-square = 15.283).

Only about one-fifth (21.1%) of the 57 MEOs and coroners’ offices require radiographer certification, as compared with 81.8% of the 11 private, university-based and hospital-based facilities (\( \chi^2 = 15.595, P < .001 \)). Further, all four of the facilities that have no training requirement were MEOs, although this still represents only 8.2% of the 49 MEOs and the difference between MEOs and other facility types in this respect is not statistically significant.

### Who Performs Imaging x Type of Facility

MEOs and coroners’ offices were slightly more likely (77.2%) than private, university-based and hospital-based facilities (60%) to provide training at the facility, but neither this difference nor any of the other differences among facility type in this respect was...
Facilities that require completion of an on-the-job training (OJT) course are more likely (88.9%) to provide training on site than are the 58.1% of facilities that do not require an OJT course ($\chi^2 = 8.358$, $P < .01$). Facilities that require radiographer certification are slightly less likely (66.7%) to provide some sort of training on site than are those that do not require certification (78.3%), but this difference is not statistically significant at even the .05 level. And one of the four facilities that has no training requirement nonetheless makes training available on site.

Percentages and totals are based on respondents.

None of the differences between type of professional performing imaging exams with respect to providing on-site training is statistically significant.
For purposes of the analyses in this subsection, types of facility were characterized as Offices of Medical Examiner (including the two facilities who checked “Other” but included “medical examiner” in their specification of that “other” type), coroner’s offices, and private, university-based, or hospital-based facilities. (There was also one remaining “Other” type of facility – a military facility – that is not included in these analyses.)

The only difference among the three facility types that reached statistical significance at the .01 level was that private, university and hospital facilities were significantly more likely to have licensing requirements (80% vs. 32.7%) than were MEOs and coroners’ offices ($t_{62} = 3.156, P = .002$). In addition, although only significant at the .05 level, private, university and hospital facilities were less likely to post technique charts (40% vs. 75.4%) than were MEOs and coroners’ offices ($t_{62} = -2.122, P = .038$).
Responses to the following question were coded as follows:

12. Who regulates or inspects the radiation equipment at your facility?

Every respondent from a private, university-based or hospital-based facility who felt they knew who regulated and/or inspected the facility “identified” the hospital or university where the facility is housed. This was true of only 6 (16.2%) of the 37 similarly knowledgeable respondents from MEOs and coroners’ offices. This difference is statistically significant at the .001 level both by chi-square test and by Fisher’s Exact Test. Among MEOs and coroners’ offices, exactly one-third (15 of 45) report being inspected/regulated by a governmental agency (significantly higher at the .05 level than the 0% of private, university and hospital facilities who so report) and another 26.7% say that a vendor or company inspects/regulates them. (This percentage is not statistically significantly higher than the private, university and hospital facilities’ 0 %.)

All three: Occasionally, a forensic anthropologist

Other response: Case by case

More than three-fourths (78.9%) of MEOs and coroners’ offices have their images interpreted by a forensic professional only, while this is true of only 38.5% of private, university-based and hospital-based facilities ($\chi^2 = 8.502, P < .001$). Conversely, 17.5% of MEOs and coroners’ offices but 61.5% of private, university and hospital facilities have their images interpreted by both forensic professionals and radiologists.
Relationship between Type of Facility and Who Interprets the Images Produced

- Radiologist only: 78%
- Forensic Professional Only: 88%
- Radiologist and Forensic Professional: 62%
- All three: 10%
- Other: 0%

Facilities:
- Office of Medical Examiner
- Coroner's Office
- Private, Univ, Hosp

Most are interpreted by the forensic pathologist but in some cases a radiologist consultant will review them at our request.  
Mostly ME but when consults we use the radiologists  
Occasionally, a forensic anthropologist  
Primary by FP but radiologist available and used for most non-GSW cases  
Radiologist about 60% of the time and ME 40%. The radiologist is consulted by the ME's when their are questions.  
Radiologist available for consult  
Radiologists at the Medical College of XXX, when requested.  
Should be digital by year end  
We ask the radiologists to interpret the infant radiographs. We interpret the gunfire and altered body images ourselves and state "no interpretation necessary" when we do not want misinterpretation of postmortem artifacts introduced into the record.  
We can consult with the radiologist at the hospital any time we have questions.  
WE have consultant radiologists available if required,  
Will have radiologist review child/infant films as needed. No radiologist used for shootings, stabbings, fires, etc.  
Total 77
Appendix B. Survey

1. Please indicate your job title.
   - Medical Examiner
   - Other (please specify below)
   Other: __________________________________________

2. In what state is your institution located?
   __________________________________________

3. In what type of facility are you employed?
   - Office of Medical Examiners
   - Other (please specify below)
   Other: __________________________________________

4. Is radiographic equipment used in your facility?
   - Yes
   - No

5. If no, is radiography performed at an off-site facility?
   - Yes
   - No

If you do not use imaging exams in your practice, please scroll to the bottom of the survey and click "Finish." Otherwise, please continue to question #6.

6. Please indicate the primary location for the types of imaging equipment you have access to.

<table>
<thead>
<tr>
<th>Equipment Type</th>
<th>At your facility</th>
<th>Off-site</th>
<th>Do not have access</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
7. Approximately what percentage of your cases require imaging exams (radiography, fluoroscopy, CT, etc.)?

- 25% or less than
- 26%-50%
- 51%-75%
- 76%-100%

8. What types of cases require imaging exams? 
Please select all that apply.

- Homicides
- Suicides
- Violent death
- Decomposed bodies
- Infant deaths
- Other (please specify below)

Other: ____________________________________________________________

If your images are only produced off site, please scroll to the bottom of the survey and click "Finish." If images are produced at your facility, please continue to question #9.

9. Who performs imaging at your facility?

- Registered radiographer
- Morphologist
- Trained ancillary staff (orderly, clerical)
- Untrained ancillary staff (orderly, clerical)
- Forensic professional (medical examiner, coroner)
- Forensic lab assistant
- Other medical (nurse, physician assistant)
- Other (please specify below)

Other: ____________________________________________________________

10. What type of training is required for personnel producing radiographic images?

- Registered radiographer [RT(R)]
- Attend a specific course of study
- Complete an on-the-job-training course
- None
- Other (please specify below)

Other: ____________________________________________________________
11. Please select yes or no for the following questions.

<table>
<thead>
<tr>
<th></th>
<th>Yes</th>
<th>No</th>
